

TOOL FOR WORKFLOW

TOOLS

- NAPKIN AI
- STORYBOOK GEMINI
- DAIGRAMGPT
- WHIMSICLE
- [VISILY.AI](#)
- STITCH GOOGLE

THEORY

Non Intrusive but effective user experience of AI-

1. Netflix recommendation
2. GMaps summarization of reviews
3. Gmail auto complete and auto suggest
4. MSFT Copilot for Email enhancements
5. Claude conversation
6. E-Commerce product recommendations
7. M365 Doc Copilot- Grammar Correction and Formatting

Non-Traditionals but interesting UXs

1. Google photos summarization
2. NotebookLM
3. Napkin ai
4. Github Copilot
5. Jira Roov
6. Lovable / emergent / bolt AI
7. Google Stitch

Concepts

1. Workflow Diagrams
 - a. User journey diagram
 - b. Data flow diagram
 - c. Interaction diagram
2. Mockups
3. Wireframes
4. Low fidelity
5. High fidelity
6. A/B Testing
7. Prototype

Story telling

Idea for AI PM- UX using AI handson

1. **Product:** LinkedIn
2. **What to improve:** Job relevance (better matching between skills and job listings)
3. **User:** Freshers and early-career professionals

Tools- Google story book

Prompt:-CHATGPT,CLAUDE,PERPLEXITY,GEMINI

You are a story creator crafting a cinematic , empathetic persona story

Ask me only these 3 inputs in one message

1. What is the product/feature to highlight
2. what is the target persona's name?
3. Which region.city is this story set in ?

After I answer, do not ask for anything else. Produce the story

Story requirements (apply automatically)

*Length 250-400 words, 6-8 short paragraphs;title + 1 -line logline on top

*Arc: Before (daily struggle with sensory detail and stakes)- inciting friction - Rising tension (time pressure, context , constraints)-product feature enters as the hero (name the feature, show how it works concretely) -transformation (specific , outcomes, relief, control) - After (new , routine , confidence , meaningful gain)- close with a hopeful image +soft call to action .

*Tone:empathetic, vivid , human ;plain language ,no jargon;culturally respectful to the given region (use natural names , moments and cues)

*show 1 short line of natural dialogue and 1-2 italicized inner thoughts from the persona to deepen connection (keep tasteful and brief)

*make the feature tangible ;include 3 concrete mechanisms woven into sentences (eg “auto sorts receipts,””predicts peak traffic,””schedules recurring orders “). Avoid bullet lists.

*Avoid hype or unrealistic claims ; no medical/financial promises;keep privacy -safe and brand safe

*focus on emotion - relief :frustration,overwhelm, or anxiety transitions to calm ,time saved, or confidence gained

*end with a subtle CTA that fits the story (e.g.,”tonight,she taps ‘start’,”).

Output format (strict)

- Title
- Logline (one sentence)
- Story (paragraphs only; non bullets , no meta commentary)

Generational steps(internal, do not display):build a brief outline ; map the persona’s day ;select 2-3 region -authentic details ; integrate the feature’s mechanisms where they naturally solve pain;convert to prose;polish for rhythm and clarity.

Begin by asking only

- “product/feature”
- “Persona name?”
- “region/city?”

Then generate the story per the above

The story The Right Job, Finally Seen

In a city full of opportunities, one fresher learns how to find the ones meant for him.

Morning traffic hummed through Bengaluru as Arjun stood at a crowded bus stop, phone in hand, scrolling endlessly through job listings on LinkedIn. The smell of filter coffee lingered from a nearby stall, but his mind was elsewhere—titles that didn’t fit, roles asking for years he didn’t have. *Why does nothing feel right?*

By noon, he had applied to seven jobs. None felt relevant. Just a routine—tap, upload, hope. His inbox stayed quiet. Each rejection, or worse, silence, made the city feel a little heavier.

“Bro, any luck?” his friend texted.

Arjun stared at the screen. “Still trying,” he replied, though even that felt uncertain.

That evening, he noticed something new on LinkedIn—**Smart Match Insights**. Curious, he tapped in. Instead of endless listings, he saw jobs ranked by relevance. Each one came with a clear **match score**, showing how closely his skills aligned. It **highlighted the exact skills he already had**, mapped directly to the job requirements. And quietly, it **flagged the missing skills holding him back**, not as failures—but as direction.

This... actually explains things.

For the first time, Arjun didn’t scroll aimlessly. He understood why a role fit—or didn’t. He adjusted his profile, added overlooked skills, and focused only on high-match roles. Fewer applications, but sharper ones.

Two weeks later, a notification popped up—not a rejection, but an interview call.

The same bus stop, same city noise—but something had shifted. Arjun stood straighter, calmer. Not chasing every job anymore. Choosing the right ones.

That night, back in his room, laptop open and city lights flickering outside, he didn’t feel lost.

He opened LinkedIn, checked his matches—and with quiet confidence, tapped “Apply.”

User Journey

User journey -is the step by step workflow of the user on the applications, what interactions does the user do with my product.

Prompt-I am trying to create a user journey diagram for the product (). the product is known for (). I am trying to solve the problem ().

Tools-

1.DiagramGPT

Product: LinkedIn

What to improve: Job relevance (better matching between skills and job listings)

User: Freshers and early-career professionals

THREE PAIN POINTS

1. Information Overload During Live Matches

Users are flooded with **scores, commentary, stats, tweets**—but lack clarity. They consume more data but understand less.

Core issue: Signal-to-noise ratio is poor.

User impact: Confusion, fatigue, disengagement in tight match moments.

2. Lack of Predictive Context

Users see *what happened* but not *what is likely to happen next*.

Core issue: No forward-looking guidance (win probability, scenario simulation).

User impact: Feels like guessing rather than informed watching.

3. Fragmented Insight Discovery

To understand the match, users jump between multiple sources—apps, Twitter, experts.

Core issue: Insights are not centralized or synthesized.

User impact: Time loss + broken experience + shallow understanding

e ideal job matching process work from the user's perspective—what are the key actions or decisions that lead to better relevance?

1. Signal Capture (Understanding the User Precisely)

Objective

Convert a vague job intent into **structured, high-quality signals**.

Key Actions

- Collect explicit inputs: role, skills, salary range, location preference
- Infer implicit signals:
 - Past applications
 - Time spent on job descriptions
 - Resume parsing (skills, projects)
- Capture constraints: remote vs onsite, company size, domain

Critical Decisions (Relevance Drivers)

- **Skill weighting:** Which skills are core vs optional
- **Intent classification:** Exploration vs urgent job seeking
- **Experience calibration:** Avoid over/under-qualified matches

👉 If this stage is weak, everything downstream fails.

2. Intelligent Matching (Ranking the Right Opportunities)

Objective

Match users to jobs using **multi-dimensional relevance scoring**, not keyword overlap.

Key Actions

- Map user profile ↔ job requirements using:
 - Skill similarity scoring
 - Experience alignment
 - Context fit (industry, company type)
- Apply behavioral signals:
 - Jobs similar users applied to
 - Recruiter engagement patterns
- Generate a ranked shortlist (not infinite scroll)

Critical Decisions (Relevance Drivers)

- **Threshold filtering:** Remove low-fit jobs early
- **Trade-off logic:**
 - High skill match vs high salary vs brand value
- **Diversity vs precision:** Avoid repetitive recommendations

👉 Most platforms fail here by over-prioritizing volume instead of precision.

3. Feedback Loop & Continuous Learning

Objective

Continuously refine recommendations based on **real user outcomes**.

Key Actions

- Track user actions:
 - Apply / skip / save / ignore
- Capture explicit feedback:
 - “Not relevant” reasons
- Measure downstream success:
 - Interview calls
 - Offer conversions

Critical Decisions (Relevance Drivers)

- **Negative signal weighting:** Skipped jobs matter more than clicks
- **Cold start handling:** New users without history
- **Adaptation speed:** How fast the system updates preferences

👉 Without this loop, relevance stagnates and trust drops.

Dataflow diagram

TOOLS:-whimsical.com

PROMPT 1:-i am trying to solve the problem of a product called LinkedIn. This is a job hiring platform that lets people connect with each other .The user problem I am trying to solve is: What **to improve:** Job relevance (better matching between skills and job listings).help me create sticky notes.

PROMPT 2:-i am trying to solve the problem of a product called LinkedIn. This is a job hiring platform that lets people connect with each other .The user problem I am trying to solve is: What **to improve:** Job relevance (better matching between skills and job listings).help me create flow charts..

PROMPT 3:--i am trying to solve the problem of a product called LinkedIn. This is a job hiring platform that lets people connect with each other .The user problem I am trying to solve is: What **to improve**: Job relevance (better matching between skills and job listings).help me with a simple interaction diagram.

Low -Fidelity mockup

TOOLS :- visily.ai

Prompt for GPT :- I have done some analysis on the problem that I am going to solve . All the collaterals are added in the document attached . Give me a concise summary of what you can infer from this. I will use that context going forward to make low fidelity , high fidelity and fully functional prototypes for my product.

Follow up prompt :- I am now going to create a low fidelity mockup using [Visibly.AI](https://visibly.ai). I need your help to give me screen by screen detailed prompt that i can enter inside Visily to create the screens . I want to create all of this in one go . So,give me a single detailed prompt for this creation.

High fidelity mockup

TOOL:- google stitch

Follow up prompt :- I am now going to create a high fidelity mockup using google stitch. I need your help to give me a screen by screen detailed prompt that i can enter into google stitch to create the screens. I want one single prompt that I can enter and see all the screens ready to create all of this in one go .

PROTOTYPE LINK :
